Serial No. 10/510,315

Atty. Doc. No. 2002P03969WOUS

Amendments To the Claims:

1-10. (canceled)

11. (currently amended) A web server comprising software modules and an expansion module

which provides the functions of a programmable logic controller, wherein Internet protocols are

provided for communication between the software modules and for communication between the

software modules and components outside of the web server, the server providing through the

expansion module a first mechanism for implementing an automation functionality, and the

server further providing a mechanism to directly access the real-time communication level of a

real-time Ethernet, wherein the expansion module is connected to an input/output module of an

automation system and wherein the web server comprises a connection to a communication

network.

12. (previously presented) The web server according to claim 11, wherein the web server

comprises a connection to a communication network.

13. (previously presented) The web server according to claim 12, wherein the communication

network is the Internet.

14. (canceled)

15. (previously presented) The web server according to claim 12, wherein Internet protocols are

provided for communication between the software modules and for communication between the

software modules and components outside of the web server.

16. (previously presented) The web server according to claim 11, wherein the web server is

adapted for configuration and administration of the software modules.

17. (previously presented) The web server according to claim 12, wherein the web server is

adapted for configuration and administration of the software modules.

2

Serial No. 10/510,315

Atty. Doc. No. 2002P03969WOUS

18. (previously presented) The web server according to claim 14, wherein the web server is adapted for configuration and administration of the software modules.

19. (previously presented) The web server according to claim 11, wherein the expansion module comprises a connection to an industrial automation system.

20 - 22. (canceled)

23. (previously presented) The web server according to claim 11, wherein the web server comprises a connection to the Internet via a firewall.

24. (previously presented) The web server according to claim 11, wherein the web server is connected via a communication network to a web browser as a control and monitoring system.

25. (previously presented) The web server according to claim 12, wherein the web server is connected via a communication network to a web browser as a control and monitoring system.

26. (previously presented) The web server according to claim 14, wherein the web server is connected via a communication network to a web browser as a control and monitoring system.

27. (previously presented) The web server according to claim 11, wherein the web server comprises a real-time operating system.

28. (previously presented) The web server according to claim 12, wherein the web server comprises a real-time operating system.

Serial No. 10/510,315

Atty. Doc. No. 2002P03969WOUS

29. (currently amended) An automation system comprising a web server having software modules including an expansion module <u>that</u> provides the functions of a programmable logic controller, <u>wherein Internet protocols are provided for communication between the software modules and for communication between the software modules and components outside of the <u>web server</u>, the expansion module providing an automation functionality with connection to an input/output module of an automation system and the server further <u>comprising a connection</u> providing direct access to the real-time communication level of a real-time Ethernet.</u>

30. (canceled)

31. (previously presented) The web server of claim 11 wherein the expansion module is a controller of components and processes, wherein the web server includes a TCP/IP stack and wherein direct access to the real-time communication level is effected by a direct connection between the TCP/IP stack and an automation device with communication by means of a TCP/IP-based real-time ethernet protocol.

32. (previously presented) The automation system of claim 29 wherein the expansion module is a controller of components and processes, wherein the web server includes a TCP/IP stack and wherein direct access to the real-time communication level is effected by a direct connection between the TCP/IP stack and an automation device with communication by means of a TCP/IP-based real-time ethernet protocol.

33. (canceled)
